## Problem Statement

The diagram shows two characters, Brad and Suzy, engaged in a conversation. Brad, on the left, is a man with brown hair wearing a dark blue sweater over a white shirt, with a teal speech bubble above his head labeled 'SD'. Suzy, on the right, is a woman with long blonde hair wearing a black blazer over a pink top, with a teal speech bubble above her head labeled 'PM'. They are positioned around a large light-blue rounded rectangle containing a list of items. Below the rectangle, the word 'Elqoo' is written in a stylized font.

**Suzy**

PAGE 13

➤ Hello Brad  
➤ Hi Suzy  
➤ We need an extra mobile client for our financial system.  
➤ Okido

Elqoo

[www.elqoo.com](http://www.elqoo.com)

.....

## Problem Statement Overview

Clients must be aware of subsystem internals

The diagram illustrates a complex subsystem structure. It features a central rectangular box labeled 'Financial System' containing several smaller rectangles representing components. Three specific nodes are highlighted with teal circles and numbered 1, 2, and 3. A red arrow points from a red callout box on the left towards node 3. The callout box contains the text: 'Clients need to know the subsystem'. Above the diagram, the text 'Clients must be aware of subsystem internals' is displayed. Below the diagram, the word 'Elqoo' is written in a stylized font.

Clients need to know the subsystem

## Façade Pattern

Intent and known as

PAGE 17

### Intent

Provide a **unified interface** to a set of interfaces in a subsystem. Façade defines a **higher-level interface** that makes the **subsystem easier to use**.

Elqoo

[www.elqoo.com](http://www.elqoo.com)

## Apply Façade Pattern

Applicability

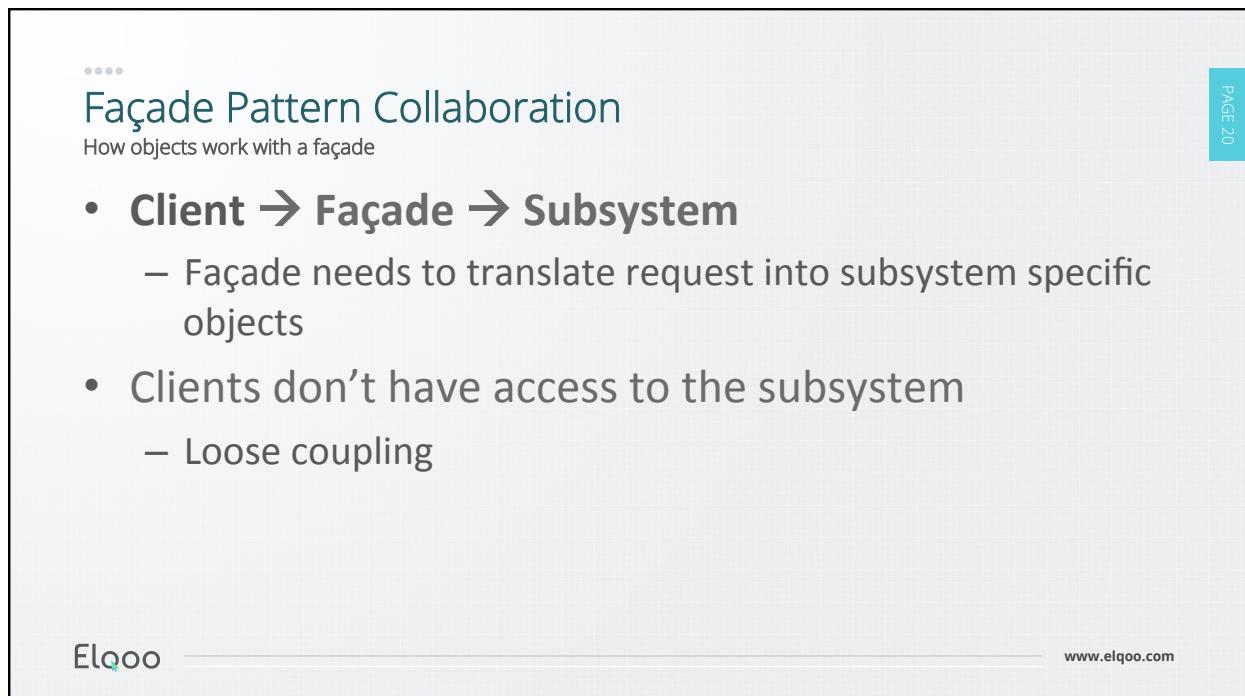

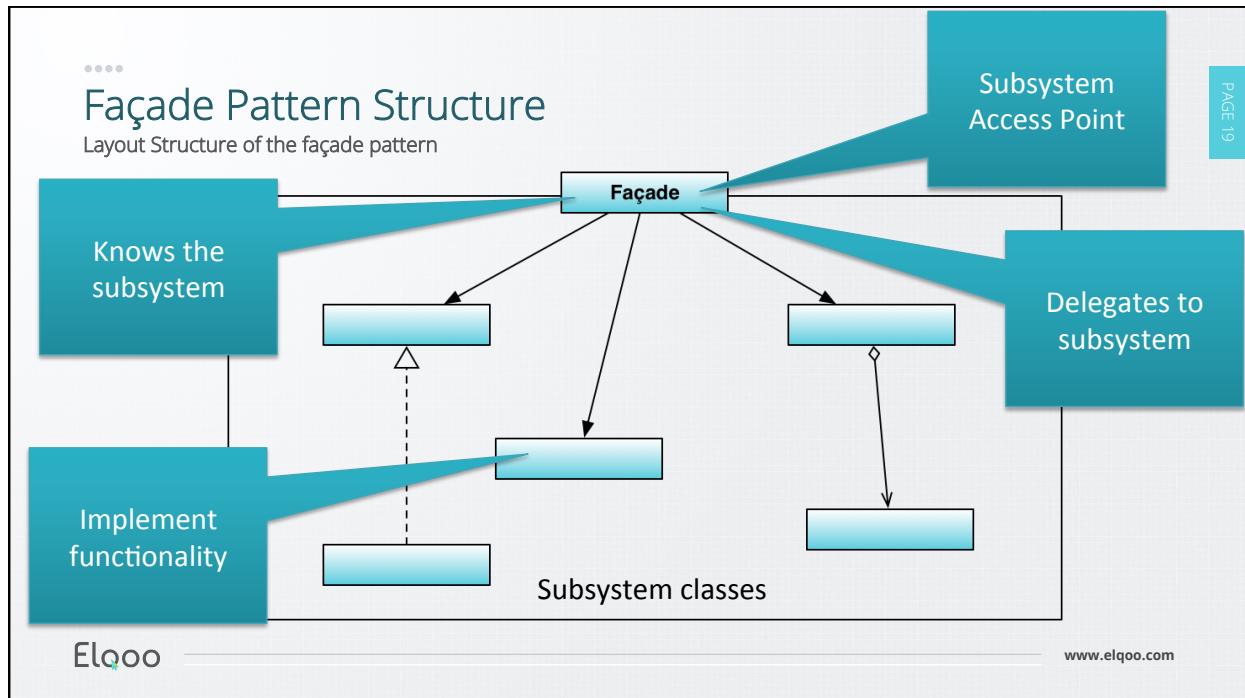

PAGE 18

- **Use**

- **Decouple** clients from subsystems
- Provide **simple interface**
- Subsystem layering (business, data and client services)

Elqoo

[www.elqoo.com](http://www.elqoo.com)

## ..... Façade Pattern Consequences

Benefits of the façade pattern

- **Benefits**

- Subsystem **easier** to use
  - Client don't require specific knowledge
- Loose coupling
- Subsystem **can still be used directly** (if necessary)

- **Drawbacks**

- Façade introduces an extra programming layer

## ..... Conclusion

- **Façade pattern is great**

- Abstract complex system from client
- Provide extra loose coupling

.....

## Problem Statement

PAGE 24

SD

Brad

- Hello Brad
- Hi Suzy
- We want to connect to our old legacy systems, but there're not conform or standards. Can it be done?
- I'll have to investigate

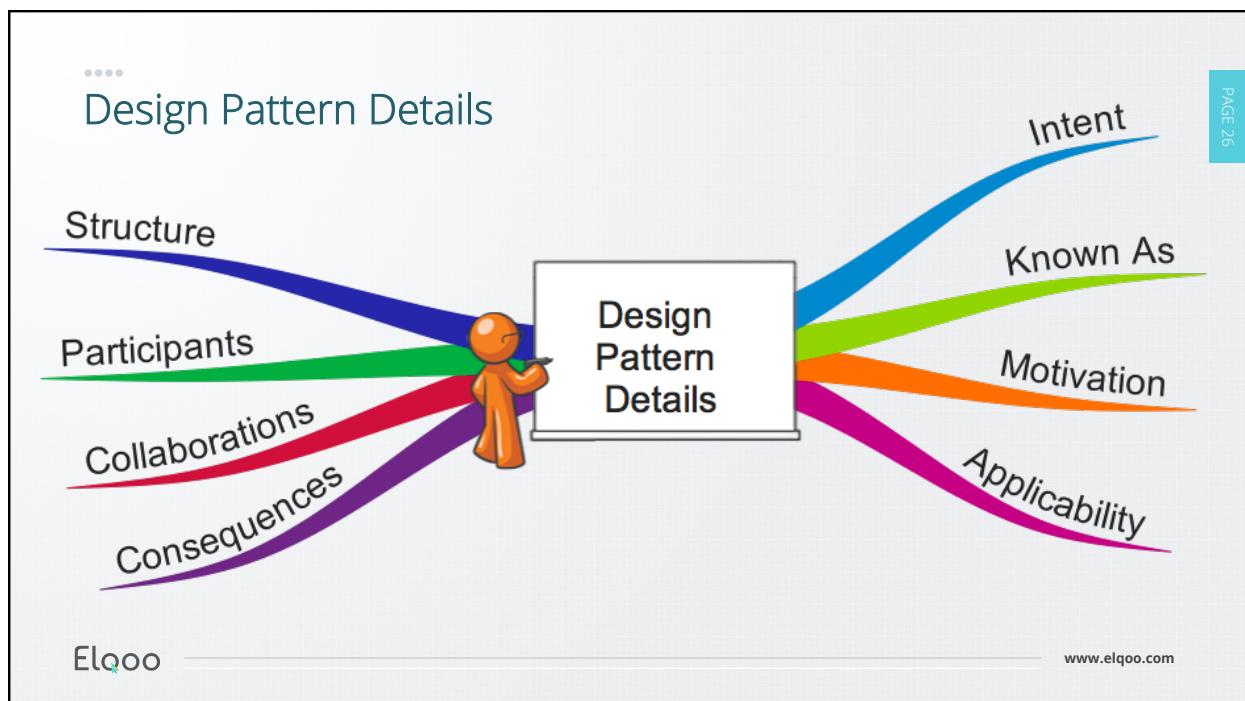

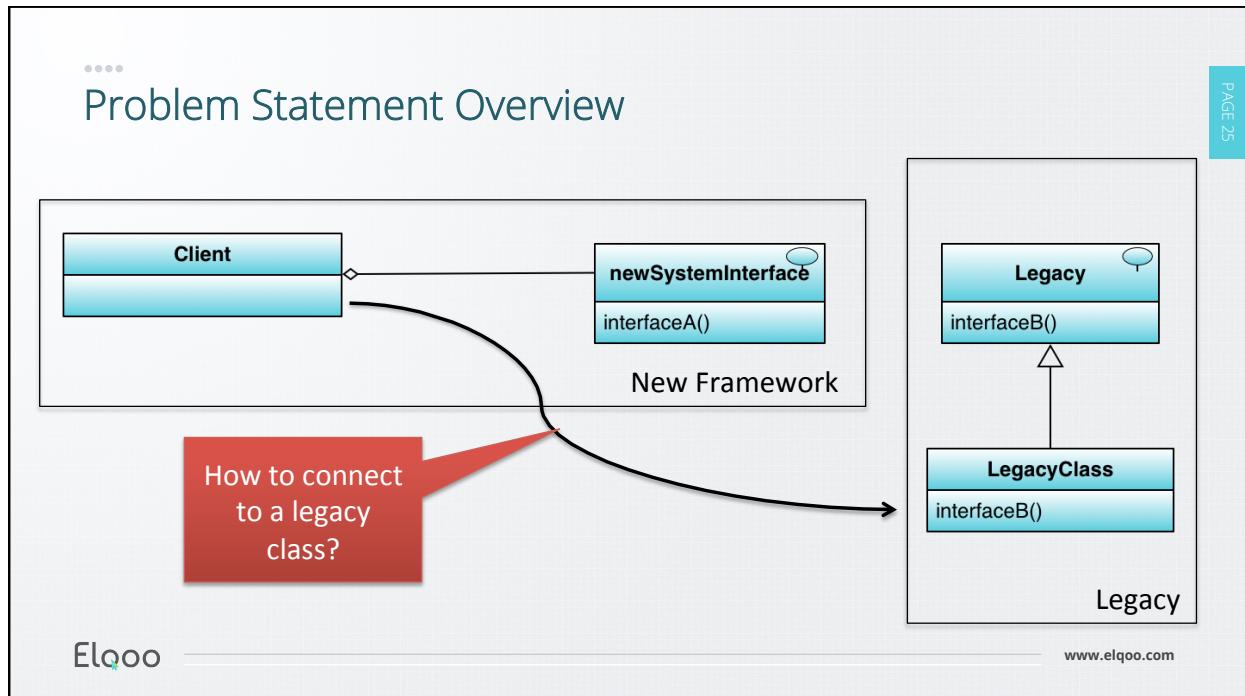

PM

Suzy

Elqoo

## Adapter Pattern

Intent and known as

PAGE 27

### Intent

**Convert the interface** of a class into another interface the clients expect. Adapter **lets classes work together** that couldn't otherwise because of incompatible interfaces.

### Known As

Wrapper

Elqoo

[www.elqoo.com](http://www.elqoo.com)

## Apply Adapter Pattern

Applicability

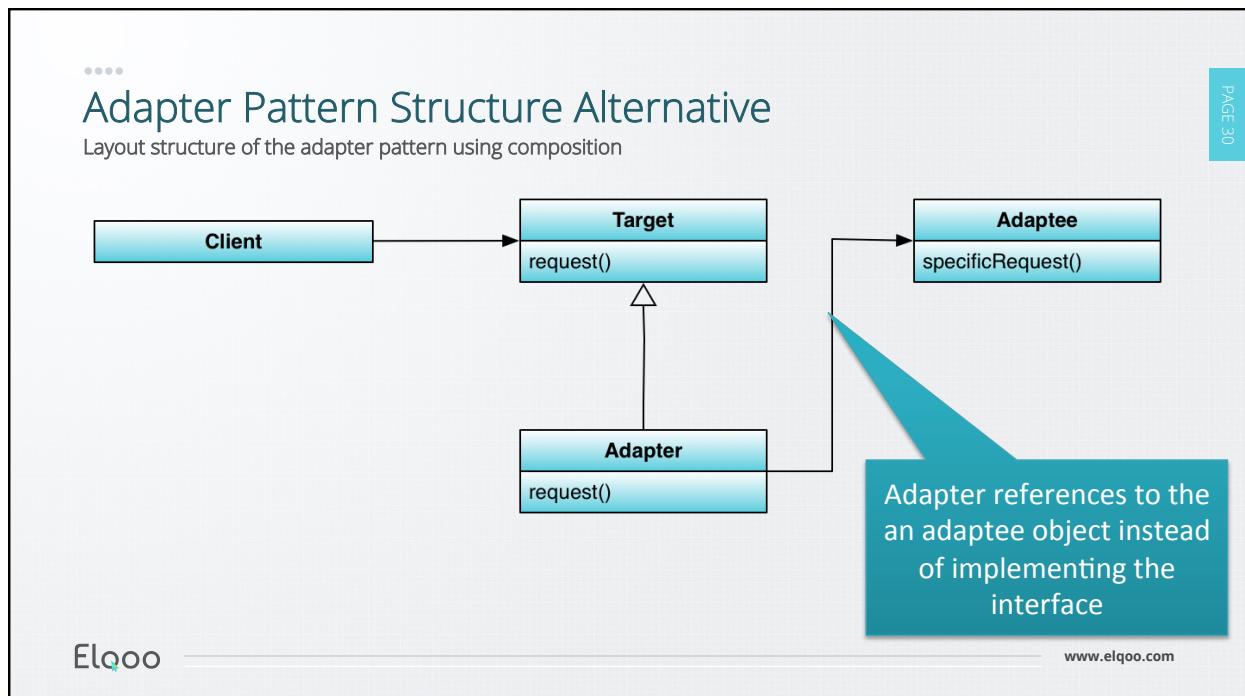

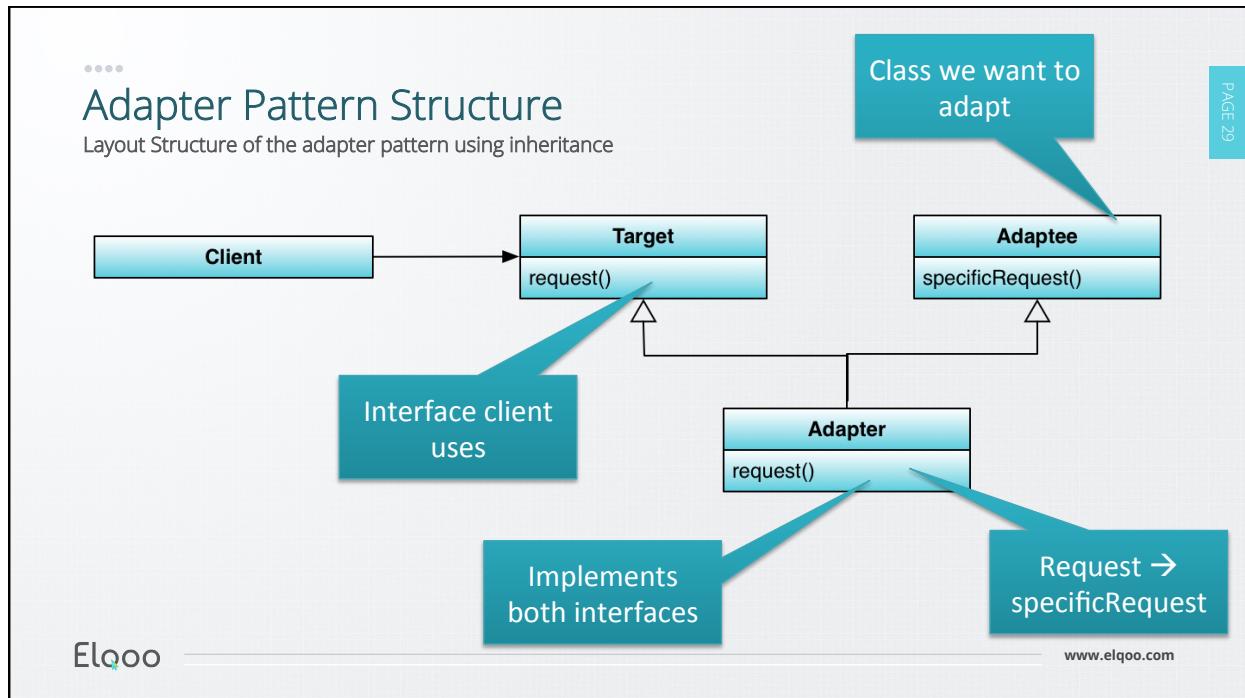

PAGE 28

- **Use**

- **Re-use** an existing class
- **Combine** unrelated **classes** with an incompatible interface

Elqoo

[www.elqoo.com](http://www.elqoo.com)

## Adapter Pattern Collaboration

Collaboration between objects

- Adapter **forwards request** to adaptee
  - This can be adapter itself (**inheritance**)
  - This can be a **reference** of the adaptee

## Adapter Pattern Consequences (1)

Considerations for the adapter pattern

- **Benefits**
  - Adapter can **override** adaptee **behaviour** → it is a subclass
  - One adapter → Many adaptees
- **Drawbacks**
  - Adapter doesn't work for
    - Class with many subclasses → can't extend them all
  - Harder to override adaptee behaviour (do we want this?)

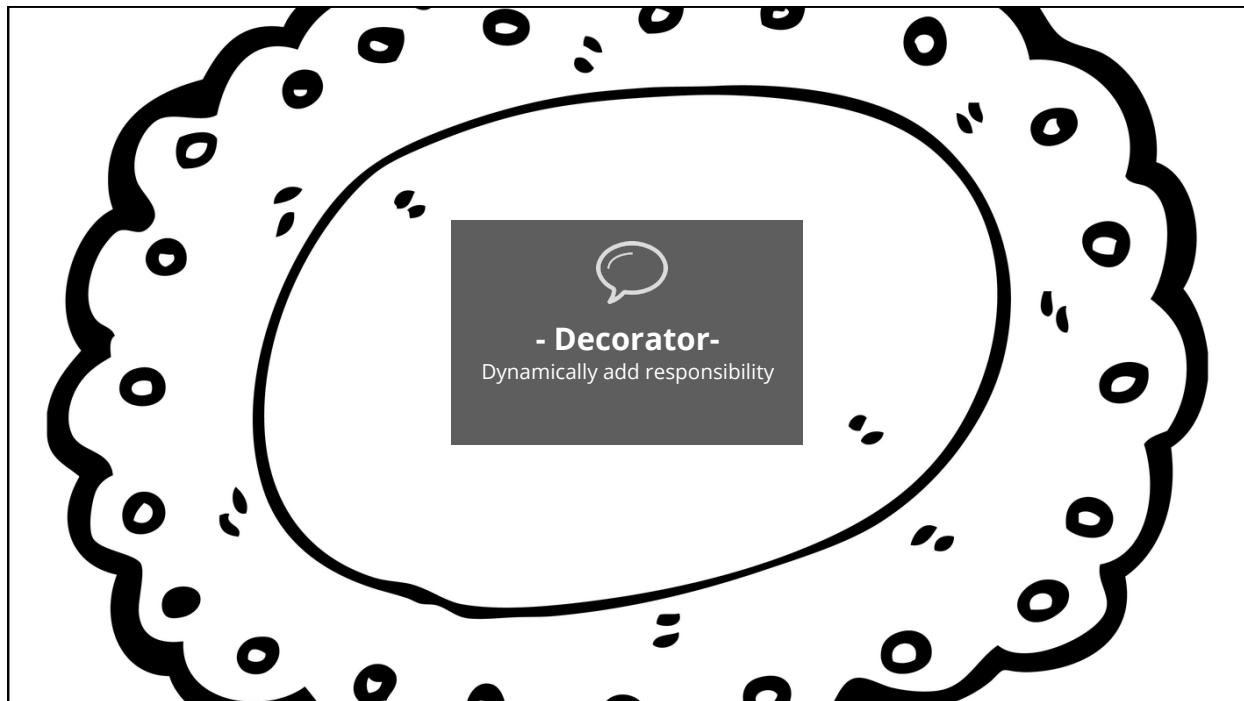

## .... Adapter Pattern Consequences (2)

Considerations for the adapter pattern

- How much adapting does the adapter do?
  - **Complex adaptations** will be hard to write.

## .... Conclusion

- **Adapter pattern is great**
  - Connect to legacy system
  - Adapt one interface to another

.....

## Problem Statement

□ / Design Patterns / Structural patterns

# Bridge Design Pattern

## Intent

- Decouple an abstraction from its implementation so that the two can vary independently.
- Publish interface in an inheritance hierarchy, and bury implementation in its own inheritance hierarchy.
- Beyond encapsulation, to insulation

## Problem

"Hardening of the software arteries" has occurred by using subclassing of an abstract base class to provide alternative implementations. This locks in compile-time binding between interface and implementation. The abstraction and implementation cannot be independently extended or composed.

## Motivation

Consider the domain of "thread scheduling".

There are two types of thread schedulers, and two types of operating systems or "platforms". Given this approach to specialization, we have to define a class for each permutation of these two dimensions. If we add a new platform (say ... Java's Virtual Machine), what would our hierarchy look like?

What if we had three kinds of thread schedulers, and four kinds of platforms? What if we had five kinds of thread schedulers, and ten kinds of platforms? The number of classes we would have to define is the product of the number of scheduling schemes and the number of platforms.

The Bridge design pattern proposes refactoring this exponentially explosive inheritance hierarchy into two orthogonal hierarchies – one for platform-independent abstractions, and the other for platform-dependent implementations.

## Discussion

Decompose the component's interface and implementation into orthogonal class hierarchies. The interface class contains a pointer to the abstract implementation class. This pointer is initialized with an instance of a concrete implementation class, but all subsequent interaction from the interface class to the implementation class is limited to the abstraction maintained in the implementation base class. The client interacts with the interface class, and it in turn "delegates" all requests to the implementation class.

The interface object is the "handle" known and used by the client; while the implementation object, or "body", is safely encapsulated to ensure that it may continue to evolve, or be entirely replaced (or shared at run-time).

Use the Bridge pattern when:

- you want run-time binding of the implementation,
- you have a proliferation of classes resulting from a coupled interface and numerous implementations,
- you want to share an implementation among multiple objects,
- you need to map orthogonal class hierarchies.

Consequences include:

- decoupling the object's interface,
- improved extensibility (you can extend (i.e. subclass) the abstraction and implementation hierarchies independently),
- hiding details from clients.

Bridge is a synonym for the "handle/body" idiom. This is a design mechanism that encapsulates an implementation class inside of an interface class. The former is the body, and the latter is the handle. The handle is viewed by the user as the actual class, but the work is done in the body. "The handle/body class idiom may be used to decompose a complex abstraction into smaller, more manageable classes. The idiom may reflect the sharing of a single resource by multiple classes that control access to it (e.g. reference counting)."

## Structure

The Client doesn't want to deal with platform-dependent details. The Bridge pattern encapsulates this complexity behind an abstraction "wrapper".

Bridge emphasizes identifying and decoupling "interface" abstraction from "implementation" abstraction.

## Example

The Bridge pattern decouples an abstraction from its implementation, so that the two can vary independently. A household switch controlling lights, ceiling fans, etc. is an example of the Bridge. The purpose of the switch is to turn a device on or off. The actual switch can be implemented as a pull chain, simple two position switch, or a variety of dimmer switches.

## Check list

1. Decide if two orthogonal dimensions exist in the domain. These independent concepts could be: abstraction/platform, or domain/infrastructure, or front-end/back-end, or interface/implementation.
2. Design the separation of concerns: what does the client want, and what do the platforms provide.
3. Design a platform-oriented interface that is minimal, necessary, and sufficient. Its goal is to decouple the abstraction from the platform.
4. Define a derived class of that interface for each platform.
5. Create the abstraction base class that "has a" platform object and delegates the platform-oriented

functionality to it.

6. Define specializations of the abstraction class if desired.

## Rules of thumb

- Adapter makes things work after they're designed; Bridge makes them work before they are.
- Bridge is designed up-front to let the abstraction and the implementation vary independently. Adapter is retrofitted to make unrelated classes work together.
- State, Strategy, Bridge (and to some degree Adapter) have similar solution structures. They all share elements of the "handle/body" idiom. They differ in intent - that is, they solve different problems.
- The structure of State and Bridge are identical (except that Bridge admits hierarchies of envelope classes, whereas State allows only one). The two patterns use the same structure to solve different problems: State allows an object's behavior to change along with its state, while Bridge's intent is to decouple an abstraction from its implementation so that the two can vary independently.
- If interface classes delegate the creation of their implementation classes (instead of creating/coupling themselves directly), then the design usually uses the Abstract Factory pattern to create the implementation objects.

## Problem Statement Detail

PAGE 71

Takes too much time to load all images out of the box

The diagram illustrates a problem statement. At the top right is a red box containing the text "Takes too much time to load all images out of the box". Below this, two light blue rectangular boxes represent components: "Application" on the left and "Image" on the right. A horizontal arrow points from the Application box to the Image box, labeled "images" above it. Two red downward-pointing arrows originate from the bottom of these boxes and point to red rectangular callout boxes. The left callout box contains the text "Application requires images". The right callout box contains the text "Pre-loads out of the box".

Elqoo

www.elqoo.com

.....

## Problem Solution

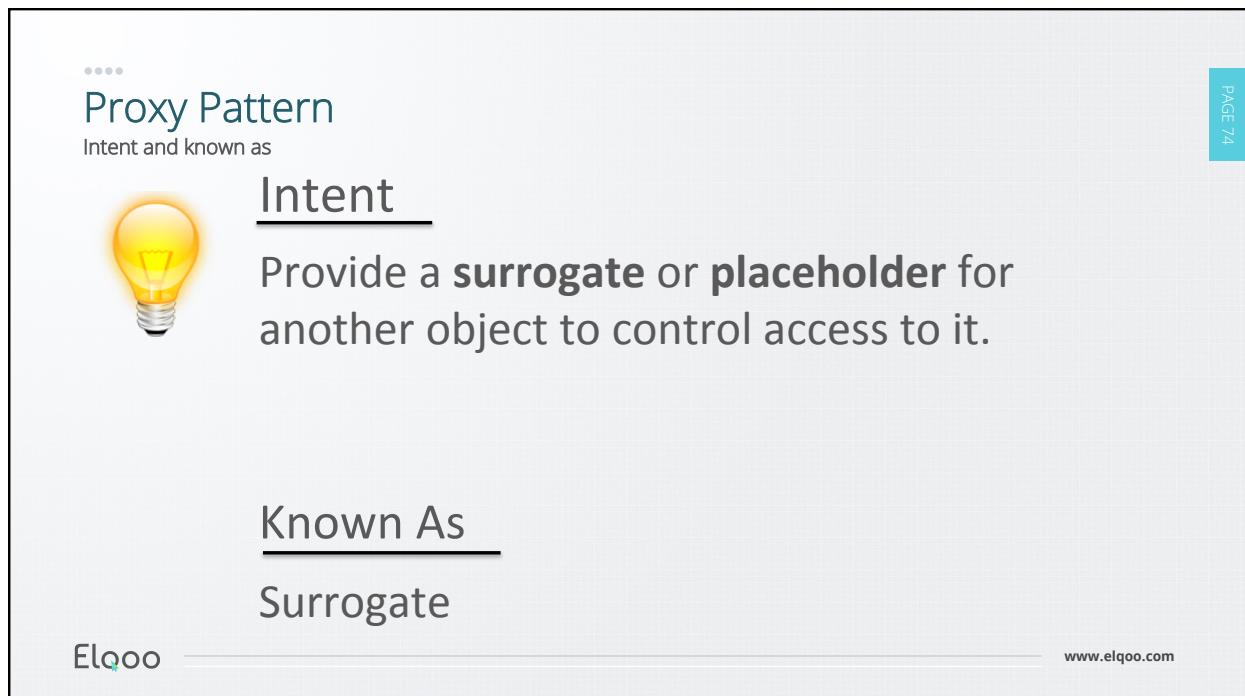

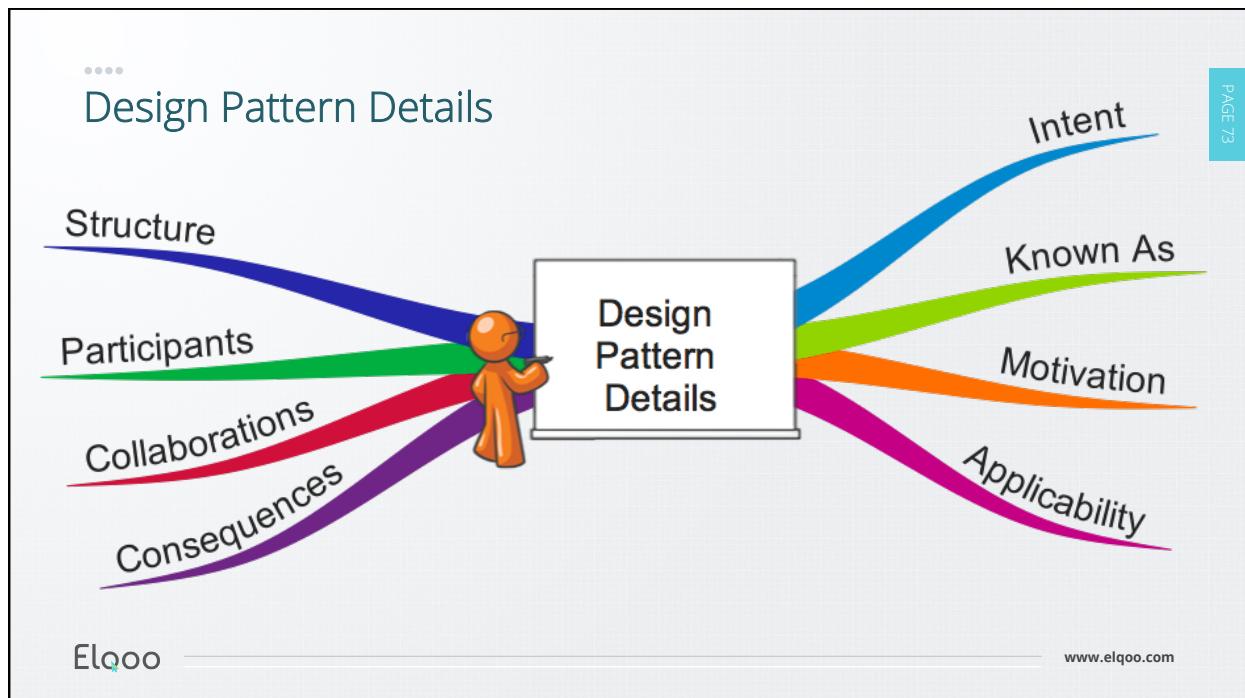

PAGE 72

Loads image when drawing is requested

The diagram illustrates a solution using a proxy pattern. It features a large teal rounded rectangle labeled "Proxy" at the bottom. Inside this rectangle is a smaller teal rounded rectangle labeled "Image". A speech bubble originates from the right side of the "Proxy" box and contains the text "Loads image when drawing is requested".

Elqoo

www.elqoo.com

## Apply Proxy Pattern

Applicability

- **Use**

- Extra functionality is required
  - Transparency
  - More than just a reference

- **Example**

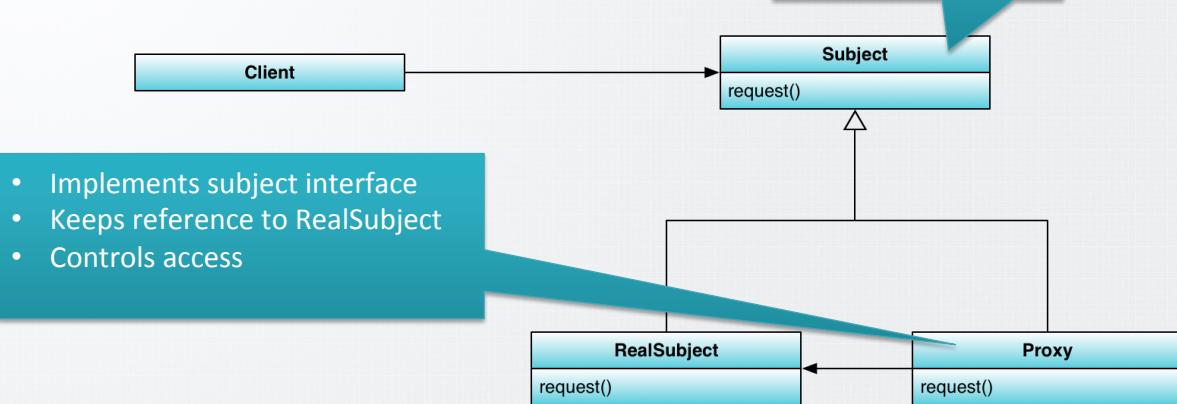

- Remote proxy (access network separated classes)
- Virtual Proxy (create expensive objects on demand)
- Protection proxy (access management)
- Added functionality e.g. count nbr of references
